

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

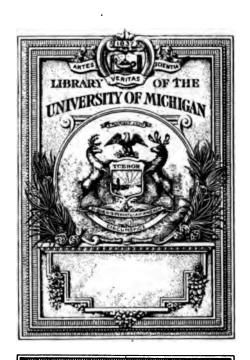

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + Refrain from automated querying Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. INTRODUCTORY

The present catalogue undertakes to give a complete enumeration of all the described Hemiptera, to and including the Chermidae, recorded from or known to occur in America north of the southern boundary of the United States. The families Aphididae, Coccidae and Aleurodidae have been omitted, largely because of the fact that I have made no careful study of these groups and feel that others are more competent to work out their synonymy. On account of their different habits and the special methods required in observing, collecting and preserving them, this omission is of little moment to students of the higher families of the Hemiptera.

The first draft of this catalogue was completed more than two years ago and as there was then no prospect of its early publication, a Check List giving the classification, synonymy and dates for all the species was prepared and, through the kindness of Mr. Wm. T. Davis of New York, was published by the New York Entomological Society. The introductory matter given below is largely a repetition of that published in the Check List and the numbering of the species in this catalogue has been made to correspond with that in the Check List to facilitate ready reference from one to the other, the species added since the publication of that list having been interpolated in fractional form. A summary of the rules used by me in working out the nomenclature of the catalogue was published in March, 1916, in the Annals of the Entomological Society of America and need not be repeated here.

While perhaps less philosophical, it has seemed best to begin this catalogue with the higher forms so as to bring it more into line with such recent works as the Oshanin, Kirkaldy, and Lethierry and Severin catalogues. For the Heteroptera the Reuter classification of 1912 has been followed very closely, but it has seemed desirable to reduce a number of his families to subfamily rank. Unfortunately the Homoptera have not been worked out with equal thoroughness, but Hansen's studies seem to show conclusively that the Fulgoridae, which I prefer for the present to retain as a single family, are the highest and most specialized of the Homoptera. In this respect also the Cicadidae appear to approach the Fulgoridae, but their develop-

ment has been along a different line. It might be more logical to consider the Membracidae as a mere subfamily of the Jassidae, and they are retained here as a separate family more out of deference to common usage. A critical study of the whole of the Homoptera may result in dividing the Fulgoridae into two or possibly three distinct families and in leaving the Membracidae and perhaps the Bythoscopidae, Cicadellidae and Jassidae as distinct families under a superfamily Cicadelloidea. Kirkaldy divides his Fulgoroidea into eight distinct families, but gives no characters from which we can judge of the value of his scheme and his divisions certainly are of unequal value. Kirkaldy also claims that the Gyponini have very little to do with the Cicadellini but he fails to give his reasons, merely rejecting the position of the ocelli as a character of any real importance. But this character certainly has more value than the horizontal extension of the head and I propose to retain my classification of 1892 until some reason is advanced for rejecting it, merely changing the value of the several groups. I might add that the division Dorydiaria is sufficiently distinguished by the venation, although the flattening of the head is characteristic, and that the Bythoscopinae in their larval and other characters are allied to the Membracidae and serve to connect them with the Jassidae.

In selecting the references to be included in this catalogue it has been my object to take such as will show the history and standing, not only of each species and genus but also of the higher groups. Here for the first time the history and synonymy of the group names higher than the genus have been worked out with as great care and accuracy as in the case of the genera and species. If this effort will help in any measure to stabilize family nomenclature, it will well repay the time and space required. I have rejected as illogical and contrary to the accepted rules of zoological nomenclature Kirkaldy's system of founding the family name on the oldest genus-name included and have adopted Dr. Horvath's system by which we give priority to family names the same as we do to the names of genera and species; and, what is really the foundation of the system, we give to each family a type genus and the family name follows that of the type genus through all its subsequent changes. For example the family Gelastocoridae was founded as Galgulidae with Gaugulus as type genus. When it was found that the name Galgulus was preoccupied and the genus was renamed Gelastocoris the family name automatically became Gelastocoridae, instead of taking the next oldest

name, Mononychidae, which would have changed the type of the family to Mononyx. Logically, we have no more right to change the type of a family than of a genus or a species.

Every one who has given the matter any study will agree that most changes in generic names come from one of two causes; changes in the accepted dates of the books in which they were published and diversity of method in the selection of geno-types. In the matter of dates I have accepted no changes unless I could feel satisfied that they were justified. There will be no uniformity in this matter until there is an official bibliography with all dates validated by an international committee, a consummation that I fear is still far in the future. Regarding geno-types I have followed the International Rules as closely as I could interpret them. As a basis I have accepted the type fixations in five of the earlier works in all cases where but one type was named. Where two or more were named I have rejected them all and accepted the next valid single fixation. The five works referred to are: Lamarck, Systême des animaux sans vertèbres, 1801; Fabricius, Systema Rhyngotorum, 1803; Latreille, Considérations générales sur l'ordre naturel des animaux, 1810; Laporte, Essai d'une classification systématique de l'ordre des Hémiptères, 1832; and Westwood, Introduction to the modern classification of insects: Synopsis, at end of vol. 2, 1840. These type-fixations have, I think, been accepted by Dr. Reuter and other European Hemipterists and probably are open to as few objections as any cases where the type species is not named in so many words in connection with each individual All these writers, with the possible exception of Fabricius, stated that they were naming types for the genera and we have Fallen for authority that he was doing so. Kirkaldy claims that Fabricius indicated types for his genera in the Entomologica Systematica in the same way that he did in his Systema Rhyngotorum, but he really made such a designation by repeating generic characters in his specific descriptions in the case of but very few hemipterous genera, and then without italics, and in his later work he omitted some of these and changed others; hence there seems to be no valid reason why we should accept these earlier ones as type-fixations.

I have here accepted the classification of geno-types devised by Mr. O. F. Cook and published in May, 1914, in the American Naturalist. These terms are:

Orthotype, a type by original designation.

Haplotype, a type by single reference (only species).

Logotype, a type by subsequent designation. Pseudotype, an erroneous type designation.

In the terminology I have uniformly used the endings idae for families, inae for subfamilies, ini for tribes and aria for divisions or subtribes, thus changing the terminations of divisions where they had been used as tribes by Reuter and others. All genera have been considered as nomina nuda until a type can be fixed, thus invalidating all genera founded without the mention of a described species. become valid and date from the naming of an included species that is recognizable and available as type. On the contrary a genus published in a systematic work, without a description but with distinct indication that it was established for a previously described valid This, however, does not include mere species, has been accepted. catalogue names unless they are given to replace a preoccupied name. The changes from either of these causes are very few in the North American Hemiptera. The most important are the use of Tibicen for Cicada of Stål and most recent writers, Meadorus Mulsant and Rey for Elasmucha Stål and Corecoris Hahn for Spartocera Laporte. The new genera established in the first part of Fieber's Die europäischen Hemiptera published in 1860 are nomina nuda there and are not recognized until they appear in the later pages with the mention of a species. Amyot's monomials, validated later by Kolenati, have been credited to the latter author and date from the publication of his descriptions.

I might add that priority, whether in the name of a species, genus or of a higher group, has been strictly followed throughout this catalogue so far as such priority was susceptible of proof.

No attempt has been made to include every published reference to each species, but I have tried not to omit one giving a useful description or figure or one that is of interest in extending the geographical range of the species. All references effecting the synonymy and history of the species, genus or family have been included. Our knowledge of the distribution of our species is still too fragmentary to allow the satisfactory naming of a "habitat" so I have contented myself with recording, by states only, the known or published localities of capture.

It has been my endeavor within each genus to arrange the species systematically so as to show their relationships. But in the genus Arctocorixa this was impossible and in certain other genera it has been but imperfectly accomplished.

As one important object of this catalogue is to show the history of each name, all references have been arranged strictly in chronological order and, in the case of species, the genus in which it was placed by each author is given if it differs from the one here adopted. In the case of names higher than genera, the original form used has been appended to each reference if it differs from that here employed, and the category is also given where different.

Preoccupied names are marked by a ||.

Names cited in error by a †.

Emendations by a ‡.

Clerical errors by a §.

Nomina nuda by a ¶.

The following names are proposed for the first time in this catalogue:

· Fitchiella for Naso Fitch.

Empoa querci var. gillettei for var. bifasciata (G. & B.)

Since the publication of the Check List in June, 1916, 263 species have been added to our North American list, of which sixteen, mostly Chermidae, are forms overlooked in the preparation of that list, and of the remaining 247 a few are exotic forms recently recognized from our territory, the balance being apparently valid new species. Ten of the species included in the Check List have since been sunk as synonymous of others, leaving a net gain of 253 species and making the total number listed in this catalogue, 3198 accepted species.

It will be noted that the original form of each name has been used here, except where a typographical error is evident. This has not been done with the idea of imposing upon our students the use of improperly formed words. In each case all published emendations have been given and each student is at liberty to use such emendations as in his judgment may seem best.

The table of additions and corrections was made up from the last proof sent me from the printers and it is quite possible that a few of the corrections included will be found to have been made on the final sheets.

An adequate recognition of the assistance received during the preparation of this catalogue would embrace a wide circle of friends and correspondents who have kindly sent me suggestions and corrections. These have contributed much toward the accuracy and value of the work and to them I wish to extend my sincere thanks. Special acknowledgments are due to Professor C. W. Woodworth

of the University of California, to Dr. Barton W. Evermann, Director of the California Academy of Sciences, whose kind consideration has greatly lightened the labor of the final preparation and printing of this work, and to Dr. E. Bergroth of Turtola, Finland, for most valuable synonymical and bibliographical information.
